

ABSTRACT

A system for reducing or eliminating objectionable e-mails and other Internet content, including pornography. The system helps prevent undesired pornographic solicitations, thus
5 helping free the personal computer user from the task of sorting and disposing of undesirable content. The system also provides increased protection against undesired pornographic Internet content for minors, and reduces unneeded Internet traffic. The system may include a content authorization processing device, a database, and an Internet data sender agreement. The system
10 employs a unique domain name addressing system whereby senders of objectionable material may be put on notice prior to sending such material.
